BNLDAG VAX GMAIL

R. Imossi

1.0 Electronic Mail Introduction

Electronic mail is the sending of a message (mail) from one computer user to another computer user. The ability to leave a message for another user eliminates "telephone tag." The recipient's computer stores the message until he or she logs in and reads it.

With the advent of computer networks, mail can be sent over networks to a user on another computer.

The BNLDAG VAX is directly connected to 3 of the 4 major world-wide networks (TCP-IP network, Bitnet, DECnet). Mail can be sent to any user on any node in the 3 networks using the standard VAX mail program, MAIL.

Mail can be sent to the remaining fourth world-wide network (UUCP) and numerous minor world-wide networks through a series of intervening computer nodes (gateways). This is done transparently by another special mail program, GMAIL.

2.0 VAX/VMS MAIL

MAIL is Digital Equipment Corporation's official mail program for VAXs. MAIL supports mailing addresses to a user on a:

local node (JOJO)
DECnet node (NODEA::JOJO)
Bitnet node (JNET%"JOJO@NODEA")
TCP-IP node (EXOS%"JOJO@NODEA").

[Note: Many examples in this document use
JOJO as user name and NODEA as node name.]

2.1 MAIL Command

By typing in the MAIL command you are then prompted for all necessary information. For example: sending a file, LETTER.TXT.

```
$MAIL
MAIL>SEND LETTER.TXT
To:  NODEA::JOJO
Subj: A word to the wise
Mail>
```

If you do not specify a file with the SEND subcommand, you are prompted for the message text. For example:

```
$MAIL
MAIL>SEND
To:  NODEA::JOJO
Subj: A word to the wise
Enter your message below. Press CTRL/Z when complete.
```

Keep the mail coming

Truly yours,
DM

```
↑Z
MAIL>
```

3.0 GMAIL

GMAIL (Gateway MAIL) is a utility, implemented by a DCL command file, designed primarily to support the sending of mail messages to nodes on networks other than those directly supported by VMS MAIL. The user interface for GMAIL is patterned closely after the sending functions of VMS MAIL. GMAIL supports a mix of "foreign network" addresses together with addresses which can be handled by VMS MAIL. GMAIL invokes VMS MAIL to deal with those addresses which are VMS MAIL addresses. Hence, GMAIL handles a super-set of MAIL addresses.

The address syntax that GMAIL supports for "foreign-network" addresses is most often in the form "user@host.domain", for instance, "USERX@NODEA.ARPA". Such mail is handled by combining your letter with a suitable header, and sending it to a "gateway" node, from where it is forwarded to its ultimate destination.

3.1 GMAIL Command

To send mail with GMAIL, is the same as with VMS MAIL, except you start with the GMAIL command. For example:

```
$GMAIL
gMAIL>SEND LETTER.TXT
gTO:  NODEA::JOJO
Subj:  A word to the wise
MAIL>
```

4.0 MAIL OR GMAIL

Try to use MAIL first. It is faster and fully supported by Digital Equipment. New features are always being added. Use MAIL for the three major networks. It can handle: DECnet, Bitnet and TCP-IP networks.

GMAIL is much slower and is not supported by Digital Equipment. Its future is uncertain. Use GMAIL for things MAIL cannot handle: for the major network:UUCP, all minor world-wide networks and for mailing addresses that are undecipherable.

5.0 Mailing Instructions

First of all, you need the recipient's mailing address. If you don't have it, create it. Second, by scrutinizing the mailing address, determine whether to use MAIL or GMAIL programs. Third, run the selected mail program.

5.1 Mailing Address Creation

To create a mailing address, you must know the network name, node name and user name. Assume node name NODEA and user name JOJO. In the following table, use the network name to find the mailing address format.

<u>Network</u>	<u>Mailing address to use</u>
DECnet	NODEA::JOJO
Bitnet	JNET%"JOJO@NODEA"
TCP-IP	EXOS%"JOJO@NODEA"
UUCP	JOJO@NODEA.UUCP

Now if the network is not one of the four major international networks, GMAIL on-line help may find you a gateway to that network. The on-line help will show you how to create the proper mailing address that will transparently get your mail through one or more gateways.

```
$GMAIL
gMAIL>HELP GATEWAYS...
```

5.2 Sending Mail

Once you have the mailing address, your last decision is whether to use VMS MAIL or GMAIL. It is always safe to use GMAIL every place VMS MAIL is used.

Continuing with using node name NODEA and user name JOJO, use the address type in the following table to determine whether to use MAIL or GMAIL. Some addresses may have domain names (fields separated by '.'s) as well as node and user names; we will use '.DOM1', '.DOM2', etc. to represent domains.

<u>Address Type</u>	<u>Program to use</u>
NODEA::JOJO	MAIL
JNET%"JOJO@NODEA"	MAIL
EXOS%"JOJO@NODEA"	MAIL
EXOS%"JOJO@NODEA.DOM1"	MAIL
EXOS%"JOJO@NODEA.DOM1.DOM2"	MAIL
EXOS%"JOJO@NODEA.DOM1.DOM2.DOM3"	MAIL
JOJO@NODEA.UUCP	GMAIL
JOJO@NODEA.DOM1	GMAIL
JOJO@NODEA.DOM1.DOM2.DOM3	GMAIL
Any other address type	GMAIL

6.0 Examples

According to the previous section, to send mail you must be given either

- a) names of network, node and user, or
- b) complete mailing address.

The examples are sectioned according to these two possibilities. Assume the message in all cases is a file LETTER.TXT.

6.1 Given name of network, node, user

Here we use section 5.1 to create the address and 5.2 to determine whether to use MAIL or GMAIL.

6.1.1 Given network:DECnet, node:BNLHEP, user:OPR

```
$MAIL
>SEND LETTER.TXT
To: BNLHEP::OPR
```

6.1.2 Given network:Bitnet, node:YALEVM, user:FOO

```
$MAIL
>SEND LETTER.TXT
To: JNET%:FOO@YALEVM"
```

6.1.3 Given network:UUCP, node:UCBJADE, user:JACK

The UUCP network can be handled only by GMAIL.

```
$GMAIL
>SEND LETTER.TXT
gTo: JACK@UCGJADE.UUCP
```

6.1.4 Given network: TCP-IP network, node:LLL-ICDC, user:OBER

```
$MAIL
>SEND LETTER.TXT
To: EXOS%"OBER@LLL-ICDC"
```

6.1.5 Given network:Hebrew University Local Area network,
Israel, node:JAF, user:LOUIE

Here we have to search GMAIL's on-line help on gateways
to find this network.

```
$GMAIL
>HELP GATEWAYS...
```

We find the network and use the example to create our
address:

```
$GMAIL
>SEND LETTER.TXT
gTo: LOUIE@JAF.HUJI.AC.IL
```

6.2 Given complete mailing address

Here we only use section 5.2 to determine whether MAIL or GMAIL
is to be used. The given mailing address is used as is.

6.2.1 Given address:

```
EDU%"TOM%NODEA.BITNET@WISCVM.EDU"
```

Sure looks like something only GMAIL can handle.

```
$GMAIL
>SEND LETTER.TXT
gTO: EDU%"TOM%NODEA.BITNET@WISCVM.EDU"
```

6.2.2 Given address

```
EXOS%"SUN!NEWS@SEISMO.CSS.GOV"
```

This fits the fifth item in section 5.2 table, so we use
MAIL.

```
$MAIL
>SEND LETTER.TXT
To: EXOS%"SUN!NEWS@SEISMO.CSS.GOV"
```

6.2.3 Given address

SYMGR%UK.AC.KCL.PH.IPG@AC.UK

\$GMAIL

>SEND LETTER.TXT

gTo: SYSMGR%UK.AC.KCL.PH.IPG@AC.UK

6.2.4 Given address

NET%"GREGG%NEMO.MATH.OKSTATE.EDU@RELAY.CS.NET"

\$GMAIL

>SEND LETTER.TXT

gTo: NET%"GREGG%NEMO.MATH.OKSTATE,EDU@RELAY.CS.NET"

7.0 Foreign Address Validation

GMAIL command, CHKADDRESS, will test the validity of a foreign mailing address without sending a message. For example:

\$GMAIL

GMAIL>CHKADDRESS USER%TAMVXOCN.BITNET@WISCVM.WISC.EDU

8.0 References

8.1 MAIL

- a) EP&S Technical Note 124 -- VAX/VMS MAIL
- b) VAX/VMS MAIL Utility Reference Manual
- c) On-line information

\$HELP MAIL

To get a hard copy of the entire help file do

\$HELP/OUTPUT=MAIL.LIS MAIL...

\$PRINT MAIL.LIS/DELETE

8.2 GMAIL

- a) Informational file on BNLDAG
BNL\$MANUAL:GMAIL.MAN

- b) On-line information

To obtain information about individual commands or topics, enter HELP followed by the command or topic name.

gMAIL> HELP [topic [subtopic...]]

All GMAIL commands

gMAIL> HELP *...

If this is your first introduction to GMAIL, then topic "Getting started" is a good place to begin. Note that you can output this HELP file (or a part of it) to a printable file by using the following sequence of commands:

```
gMAIL> $DEFINE/USER SYS$OUTPUT your-file
gMAIL> HELP *...
Topic? Z
gMAIL> $PRINT/DELETE your-file
```

- c) To contact the creator and maintainer of GMAIL see:

```
Ed Miller, SLAC
Physnet:  TWGM::ESMP09
BITNET:   ESMP09@SLACVN
```

8.3 Networks in General
