**The Improvement of the Vertical Dispersion Matching  
of the Beam Transport Line Between AGS and RHIC**

Jianming Xu

June 1990

# The Improvement of the Vertical Dispersion Matching of the Beam Transport Line Between AGS and RHIC

Jianming Xu

In the beam transport line from AGS to RHIC due to vertical bending of the central orbit in some places the vertical dispersion is not zero. But at the injection point of RHIC the dispersion functions  $\eta_y$  and  $\eta'_y$  should be zero so as to match the parameters of RHIC. Otherwise there will be a vertical phase space dilution. The related dilution factor can be expressed as follows:

$$\frac{\epsilon}{\epsilon_0} = \left[ 1 + \sqrt{\frac{\epsilon_c}{\epsilon_0}} \right]^2 \quad (1)$$

where

$$\epsilon_c = \gamma(D\delta)^2 + 2\alpha(D\delta)(D'\delta) + \beta(D'\delta)^2 \quad (2)$$

And  $D = \eta - \eta_0$ ,  $D' = \eta' - \eta'_0$ , in which  $\eta_0$  and  $\eta'_0$  are the ideal values of the dispersion functions. And  $\delta$  is the relative momentum deviation of the particles due to injection momentum mismatch or momentum spread of the injection beam.

In the original lattice of the beam transport line,<sup>1</sup> at the injection point  $\eta_y = 0.228$  m,  $\eta'_y = 0.006$ . The corresponding phase space dilution factor will be about 112% for  $\delta = 10^{-3}$ . The lattice of the beam transport line has been modified to improve the vertical dispersion matching. An additional quadrupole QMI5' is installed 4.257 meters downstream of QMI4 and the strengths of the quadrupoles in M-line (QMI1 to QMI7) and quadrupoles in V-line are adjusted to match the required parameters at the injection point of RHIC and keep the beam envelop to be less than the allowable value. In the lattice there is a low  $\beta$  waist for foil SA between UQ5 and UQ6 which is the first variant described in reference 2.<sup>2</sup>

Two variants are described in this note. The main difference between the two lattices is the total phase shift. In the first variant,  $MUX = 5.542$  and  $MUY = 5.359$ . The relations between the position error  $x_2(y_2)$  and direction error  $x'_2(y'_2)$  at the injection point of RHIC and the errors of the AGS ejection beam  $x_1, x'_1 (y_1, y'_1)$  are as follows:

$$x_2 = 0.14x_1 - 4.8x'_1, \quad (3)$$

$$x'_2 = 0.26x_1 - 1.96x'_1; \quad (4)$$

$$y_2 = 0.46y_1 + 15.5y'_1, \quad (5)$$

$$y'_2 = -0.07y_1 - 0.26y'_1. \quad (6)$$

---

<sup>1</sup> J. Claus and H. Foelsche, Beam transfer from AGS to RHIC, AD/RHIC-47, 1988.

<sup>2</sup> Jianming Xu, The effect of the stripping foil SA on the injection beam of RHIC, AD/RHIC/RD-18, 1990.

In the second variant,  $MUX = 5.867$  and  $MUY = 5.499$ . The corresponding relations are:

$$x_2 = 2.1x_1 - 13.7x'_1, \quad (7)$$

$$x'_2 = -0.13x_1 + 1.36x'_1; \quad (8)$$

$$y_2 = -2.47y_1 + 0.12y'_1, \quad (9)$$

$$y'_2 = -0.053y_1 - 0.40y'_1. \quad (10)$$

In equations (3) to (10),  $x, y$  are expressed in meters and  $x', y'$  in radians. Comparing the above equations we can find that, the first variant is less sensitive to the AGS ejection beam horizontal position error  $x_1$ , and angular error  $x'_1$ , which are caused by the instability of the AGS ejection system and the ejection beam energy error. These errors are the most dominant errors and are difficult to be cured by control system. Another difference is the  $\beta$  value at SA. In the first variant  $\beta_x$  and  $\beta_y$  are 6.14 meters and in the second variant they are 5.5 meters. The relative emittance growth at SA will be 8.2% for the first variant which is larger than 7.4% for the second variant. After overall study of the performance of the two variants we can select the lattice finally.

The parameters of the elements of the first variant are shown in Table 1. The Twiss parameters and the relative positions of the elements are shown in Table 2. The parameters of the elements of the second variant can be found from Table 3 and the Twiss parameters are shown in Table 4. Table 2 and 4 are the output of MAD in which the distances in rectangular bending magnets are the linear distance but not the arc length of the central orbit.

In the modified lattices at the Big Bend there is small vertical dispersion. The maximum value of  $\eta_y$  in the bending magnets is about 0.33 meters occurring in G1D magnet for both variants, which will increase the beam half height by 0.33 mm (if the momentum spread of the beam is 0.001). The maximum half beam height in the bending magnets of the Big Bend is about 5.9 mm ( $\sqrt{38.7\epsilon_0 + 0.327\delta}$ ) or 5.6 mm  $(38.7\epsilon_0 + 0.327^2\delta^2)^{1/2}$  for the first variant and is 6.3 mm ( $\sqrt{43.8\epsilon_0 + 0.327\delta}$ ) or 5.9 mm  $(43.8\epsilon_0 + 0.327^2\delta^2)^{1/2}$  for the second variant. In both variants the maximum beam height is less than half of the useful vertical aperture of the magnets.

### Acknowledgments

I am thankful to Drs. J. Claus, H. Foelsche and A.G. Ruggiero for helpful discussions.
